Cueon

? Live Q&A cue cards for presenters

? On Meta Ray-Ban Display

? Built with Muse Spark and Muse Voice Transcribe

The problem

? Q&A is the part of a talk you can't rehearse

? Presenters miss the question, blank on the number, or ramble

? A pause of 0.6 to 1.2 seconds already reads as hesitation

Who it's for

? Non-native speakers presenting in English

? Hackathon finalists, founders pitching investors, researchers at conferences

? About 30% of early-career non-English researchers skip English conferences

How it works

? Before the talk: upload slides, plan, papers and data

? Cueon predicts questions and writes a checked card for each

? During Q&A: pinch to listen, the card appears on the lens

Checked cards, not guesses

? Every number on a card must appear on the cited page

? A judge model checks each claim against that page

? Rejected cards are rewritten up to 3 times, then flagged as gaps

Latency

? Prepared cards: matched locally, no model call

? New questions: Muse Spark streams a card from the cached material

? Target: card on the lens within 1.5 s (p50) and 2.5 s (p95)

While you present

? Follows your talk page by page from what you say

? Flags key points you skipped before you move on

? Shows time left and a short version when time runs out

Privacy

? Push to listen: the mic is off until you pinch

? Audio is never stored and speakers are never identified

? Local mode runs Muse Glimmer on your laptop for confidential decks

Competition

? Teleprompters show a fixed script and can't react to questions

? Live captions show words, not answers

? Cueon answers from your own material, built only for live Q&A
